INFORMATION DISCLOSURE STATEMENT

Mail Stop PCT

Commissioner for Patents

P.O. Box 1450

Alexandria, VA 22313-1450

Sir:

In compliance with the duty of disclosure under 37 C.F.R. § 1.56, Applicants respectfully request that this Information Disclosure Statement be entered and that the references listed on attached Form PTO-1449 be considered by the Examiner and made of record.

10/566941

AP20 Rec'd PCT/PTO 02 FEB 2006

The present application is a §371 national application of PCT Application No. PCT/US2004/023050, filed July 16, 2004. The PCT Application is relied upon for an earlier filing date under 35 U.S.C. § 120. In accordance with Rule 37 C.F.R. § 1.98(d), a copy of the listed documents A1 and C1-C7 are not enclosed as they have been previously cited by or submitted to the U.S. Patent and Trademark Office in the International Search Report mailed March 21, 2005. A copy of the reference C8 is attached.

In accordance with 37 C.F.R. § 1.97(g), this Information Disclosure Statement is not to be construed as a representation that a search has been made or that no other possibly material information, as defined in 37 C.F.R. § 1.56, exists.

The present Information Disclosure Statement is being filed prior to the receipt of a first Office Action on the merits; and hence, is believed to be timely-filed in accordance with 37 C.F.R. § 1.97(b). No fees are believed to be due in connection with the filing of this Information Disclosure Statement; however, if any fees should be due, the Commissioner is hereby authorized to deduct said fees from Deposit Account No. 01-2508/11916.0058.PCUS02.

Applicant respectfully requests that the listed documents be made of record in the present case.

Respectfully submitted,

Patricia A. Kammerer

⁴D. Ciencia Animal I dels Aliments, UAB, Barcelona

The leptin receptor gene (LEPR) is a candidate for traits related to growth and body composition, and it is located on SSC6 in a region where several QTL have been detected. The aims of this work were: a) to verify these QTL on a larger sample of animals and generations and b) to examine the effects of the LEPR variants on fatness and body composition traits, to evaluate the causality of the polymorphisms analyzed respect to the QTL. Three missense polymorphisms, located on exons 4 (T69M), 9 (D382A), and 14 (L663F), have been genotyped by pyrosequencing in a cross between Landrace and Iberian pigs comprising 33 F₀, 70 F₁, 418 F₂, 86 F₃, and 128 individuals coming from the backcross of four F₂ males with 24 Landrace females. Thirteen microsatellites and one SNP on *MC1R* gene were also genotyped. Traits analyzed were: backfat thickness (BFT), intramuscular fat percentage (IMF), and eye muscle area (MA). Four statistical models were used. For the QTL study, a QTL detection model with sex and batch as fixed effects and a two-QTL model were applied. For the candidate gene study, an animal model with the effect of LEPR alleles, and a QTL model including the effect of LEPR haplotypes as fixed effects were evaluated. The results support the presence of two QTL on SSC6, one affecting BFT (position 60 cM), and the other and more significant one affecting BFT, IMF, and MA (position 130 cM). Results also confirm the implication of LEPR gene variants on the variability of these traits. The Iberian LEPR haplotype increases BFT and reduces MA. Functional studies are required to explain the effects observed.
